STEEL

Our main product is low-alloy casting. While melting pieces of old metal in the electric induction furnace we add ferro-alloy required for special materials for tooth, point and adapter. Made of excellent quality materials, each of our products is the outcome of an optimal production system ranging from the management of metal, melting, and injection to heat treatment. Our products represent outstanding standards of durability, hardness and shock resistance. Our products are widely used at construction sites and mines, proving that the products are durable and solid.

HARDNESS

Hardness is measured by physical resistance against continuous transformation of the steel surface. This is seen as resistance to sliding and scratching. With optimal alloy ratio and heat treatment our products guarantee an excellent standard of hardness. The even hardness on the surface and deep inside the products provides superior abrasion resistance.

CHARRY IMPACT ENERGY

Impact value together with hardness is an importance fact or in steel. It measures the amount of energy absorbed by steel before it breaks. Products with high impact value are more appropriate in places like rocky mountains where impact and sliding abrasion occur simultaneously. Our products with high hardness as well as high impact value, do not easily break and wear in an environment that produces strong impacts.

WEAR RESISTANCE

Wear resistance is a very complicated process involving a range of variables, and thus is difficult to measure. However, the high-quality material of our tooth and adapter can withstand pressure from any topographical conditions. The products provide high impact value and hardness, endure high temperatures caused by friction, and consequently reduce abrasion to the lowest extent.
